

Sensored Brushless Competition ESC

**SUPER VORTEX**

**ZERO**

670A02356A

**SUPER VORTEX**  
**ZERO**

Tips - How to improve.

● Drivers feel suddenly for initial motor rotation while operating throttle.

Setting neutral / high-point ⇒ Turning neutral position to high side by throttle trim ⇒  
Returning one trim position and no sound from situations for no motor rotation ( Beep  
from motor ) # Trim adjustment is minimum step.

● Drivers feel sudden motor rotation on Mid-speed range while operating throttle.

Feeling small torque on Mid-speed range from putting boost or turbo ⇒ (1) Changing  
setting of power mode and adjusting putting boost or turbo or (2) Setting adjustable  
rate control (ARC) of throttle into plus side or minus side.

# Some differences due to motor's characteristic, so please adjust while actual  
operation.

You can experience the more advanced system with the set of SUPER VORTEX ZERO and RX-472.
